

Masters Student Research Opportunity in Invertebrate Paleontology/Stratigraphy

I am currently seeking a student to undertake NSERC-funded masters-level research on systematics, biostratigraphy, and paleobiogeography of Ordovician-Silurian graptolites from northern Yukon and/or the Canadian Arctic Islands. There is potential for field work in one of these regions. The research will part of integrated studies of litho-, chemo-, and biostratigraphic data, attempting to better understand the long-term relationship between marine plankton biodiversity and paleoenvironmental change in the Ordovician-Silurian oceans. If you are interested, please contact:
